Basic Function Instruction

T

TIMER

T

Symbol

<

T	TIMER		T
Example 1	Constant preset value		
<div><div><div><div>Ladder diagram</div><div></div></div><div><div>Key operations</div><div></div></div><div><div>Mnemonic code</div><div>ORG X 1 T0 PV: 1000 FO 0 OUT Y 0 ORG SHORT SET M 1957 ORG X 1 T1 PV: 1000</div></div></div></div>			
<div><div><div><div>① M1957=0 (Defaulted)</div><div>② M1957=1</div></div><div></div></div></div>			
Example 2	Variable PV		
<p>The preset value (PV) shown in example 1 is a constant which is equal to 1000. This value is fixed and can not be changed once programmed. In many circumstances, the preset time of the timers needs to be varied while PLC running. In order to change the preset time of a timer, can first use a register as the PV operand (R or WX, WY...) and then the preset time can be varied by changing the register content. As shown in this example, if set R0 to 100, then T becomes a 10S Timer, and hence if set R0 to 200, then T becomes a 20S Timer.</p>			

Basic Function Instruction

Cn						○																																																															
PV	○	○	○	○	○	○	○	○	○	○	○	○	○																																																								
Description	<ul style="list-style-type: none"> ● When "CLR" is at 1, all of the contact Cn, FO0 (CUP), and CV value of the counter CV are cleared to 0 and the counter stops counting. ● When "CLR" is at 0, the counter is allowed to count up. The Counter counts up every time the clock "CK ↑" changes from 0 to 1 (adds 1 to the CV) until the cumulative current value is equal to or greater than the preset value (CV≥PV), the counter "Count-Up" and the contact status of the counter Cn and FO0 (CUP) changes to 1. If the input status of clock continues to change, even the cumulative current value is equal and greater than the preset value, the CV value will still accumulate until it reaches the up limit at 32767 or 2147483647. The contact Cn and FO0 (CUP) stay at 1 as long as CV≥PV unless the "CLR" input is set to 1. (please refer the diagram ① below) ◦ ● If the FBs-PLC OS version is higher than V3.0 (inclusive), the M1973 can set to 1 so the CV will not accumulate further after "Count Up" and stops at the PV. M1973 default value is 0, therefore the status of M1973 can be set before executing any counter instruction in the program to individually set the counter CV to continue accumulating or stops at the PV after "Count Up" (please refer to the diagram ② below).

FUN 0 MC	MASTER CONTROL LOOP START	FUN 0 MC
<div></div> <div><p>Remark1:MC/MCE instructions can be used in nesting or interleaving as shown to the right:</p><p>Remark2: • When M1918=0 and the master input changes from 0→1, and if pulse type function instructions exist in the master control loop, then these instructions will have a chance to be executed only once (when the first time the master control input changes from 0→1). Afterwards, no matter how many times the master control input changes from 0→1, the pulse type function instructions will not be executed again.</p><ul style="list-style-type: none">• When M1918=1 and the master control input changes from 0→1, and if pulse type function instructions exist in the master control loop, then each time the master control input changes from 0→1 the pulse type function instructions in the master control loop will be executed as long as the action conditions are satisfied.• When a counting instruction exists in the master control loop, set M1918 to 0 can avoid counting error.• When the pulse type function instructions in the master control loop must act upon the 0→1 input change by the master control, the flag M1918 should be set to 1.</div> <div></div>		

Basic Function Instruction

FUN 1 MCE	MASTER CONTROL LOOP END	FUN 1 MCE
Symbol	<p style="text-align: right;"><u>Operand</u></p> <div style="display: flex; align-items: center; justify-content: space-between;"> <div style="text-align: center;"> <p><u>Ladder symbol</u></p>  </div> <div> <p>N: Master Control End number (N=0~127) N can not be used repeatedly.</p> </div> </div>	
Description	<ul style="list-style-type: none"> ● Every MCE N must correspond to a Master Control Start instruction. They must always be used as a pair and you should also make sure that the MCE N instruction is after the MC N instruction. After the MC N instruction has been executed, all output coil status and timers will be cleared to 0 and no other instructions will be executed. The program execution will resume until a MCE instruction which has the same N number as MC N instruction appears. ● MCE instruction does not require an input control because the instruction itself forms a network which other instructions can not connect to it. If the MC instruction has been executed then the master control operation will be completed when the execution of the program reaches the MCE instruction. If MC N instruction has never been executed then the MCE instruction will do nothing. 	
Description	<ul style="list-style-type: none"> ● Please refer to the example and explanations for MC instruction. 	

FUN 2 SKP	SKIP START		FUN 2 SKP
Symbol			
<div><div><div>Ladder symbol</div><div><div>Skip control — EN</div><div><div>2. SKP</div><div>N</div></div></div></div></div>		<div>Operand</div> <div>N: Skip loop number (N=0~127), N can not be used repeatedly.</div>	
Description	<div><div><div><div>●</div><div>There are total 128 SKP loops (N=0~127). Every skip start instruction, SKP N, must correspond to a skip end instruction, SKPE N, which has the same loop number as SKP N. They must always be used as a pair and you should also make sure that the SKPE N instruction is after the SKP N instruction.</div></div><div><div>●</div><div>When the skip control "EN" is 0, then the Skip Start instruction will not be executed.</div></div><div><div>●</div><div>When the skip control "EN" is 1, the range between the SKP N and SKPE N which is so called the Skip active loop area will be skipped, that is all the instructions in this area will not be executed. Therefore the statuses of the discrete or registers in this Skip active loop area will be retained.</div></div></div></div>		
Example			
<div><div><div>Ladder Diagram</div><div></div></div></div>	<div><div><div>Key Operations</div><div></div></div></div>	<div><div><div>Mnemonic Codes</div><div><div>ORGX0</div><div>FUN2</div><div>N :1</div><div>ORGX1</div><div>OUTY0</div><div>ORGX2</div><div>T201PV :10</div><div>ORGT201</div><div>OUTY1</div><div>FUN3</div><div>N :1</div><div>ORGX1</div><div>OUTY2</div></div></div></div>	

FUN 3 SKPE	SKIP END	FUN 3 SKPE
Symbol	<div><div><div><div><div></div><div>3.</div><div>SKPE</div></div><div>N</div></div></div><div><div><div></div><div>Ladder symbol</div></div><div><div>Operand</div><div>N : SKIP END Loop number (N=0~127) N can not be used repeatedly.</div></div></div></div>	
Description	<div><div><div></div><div>● Every SKPE N must correspond to a SKP N instruction. They must always be used as a pair and you should also make sure that the SKPE N instruction is behind the SKP N instruction.</div></div><div><div></div><div>● SKPE instruction does not require an input control because the instruction itself forms a network which other instructions can not connect to it. If the SKP N instruction has been executed then the skip operation will be completed when the execution of the program reaches the SKPE N instruction. If SKP N instruction has never been executed then the SKPE instruction will do nothing.</div></div></div>	
Example	<div><div><div></div><div>● Please refer to the example and explanations for SKP N instruction.</div></div><div><div></div><div>Remark : SKP/SKPE instructions can be used by nesting or interleaving. The coding rules are the same as for the MC/MCE instructions. Please refer to the section of MC/MCE instructions.</div></div></div>	

Basic Function Instruction

FUN 4 DIFU	DIFFERENTIAL UP		FUN 4 DIFU														
Symbol	<div><div><div>Ladder symbol</div><div>Input status —TGU —<div>4.<div>DIFU</div><div>D</div></div></div><div><div>Operand</div><div>D: a specific coil number where the result of the Differential Up operation is stored.</div></div></div><table><tr><th>Range</th><th>Y</th><th>M</th><th>SM</th><th>S</th></tr><tr><td rowspan="2">Ope- rand</td><td>Y0 Y255</td><td>M0 M1911</td><td>M1912 M2001</td><td>S0 S999</td></tr><tr><td><input type="radio"/></td><td><input type="radio"/></td><td><input type="radio"/>*</td><td><input type="radio"/></td></tr></table></div>			Range	Y	M	SM	S	Ope- rand	Y0 Y255	M0 M1911	M1912 M2001	S0 S999	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>

FUN 5 P
DIFD

DIFFERENTIAL DOWN

FUN 5 P
DIFD

Symbol

Ladder symbol

Input status—TGD

5.
DIFD

D

Operand

N: a specific coil number where the result of the Differential Down operation is stored.

Range	Y	M	SM	S
Ope- rand	Y0	M0	M1912	S0
	Y255	M1911	M2001	S999
D	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>

Description

- The DIFD instruction is used to output the down differentiation of a node status (status input to "TGD") and the pulse signal resulting from the status change at the falling edge of the "TGD" for one scan time is stored to a coil specified by D.
- The functionality of this instruction can also be achieved by using a TD contact.

Example

The results of the following two samples are exactly the same

Description																																													
<ul style="list-style-type: none">When the status of clear control "CLR" is at 1, then the data of register D and FO0 will all be cleared to 0. Other input signals are all in effect.When the status of clear control is "CLR" at 0, then the shift operation is permissible. When the shift control "EN" = 1 or from 0 →1 (P instruction), the data of the register will be shifted to right (L/R=0) or to left (L/R=1) by one bit. The shifted-out bit (MSB when shift to left and LSB when shift to right) for both cases will be sent to FO0. The vacated bit space (LSB when shift to left and MSB when shift to right) due to shift operation will be filled in by the input status of fill-in bit "INB".																																													
Example																																													
Shifts the 16-bit register data

<div>Timing Diagram</div> 																										
<p>Remark 1: Since the counting operation of UDCTR is implemented by software scanning, therefore if the clock speed is faster than the scan speed, lose count may then happen (generally the clock should not exceed 20Hz depending on the size of the program). Please use the software or hardware high-speed counter in the PLC. Refer to the “High Speed Counter Application” in the Advanced Manual.</p>																										
<p>Remark 2: In order to ensure the proper counting, the sustain time of the status of clock input should greater than 1 scan time.</p>																										

FUN 8DP
MOV

MOVE
(Moves data from S to D)

FUN 8DP
MOV

Description

Ladder symbol

8DP.MOV

Move control — EN

S :

D :

Operand

S: Source register number
D: Destination register number
The S, N, D may combine with V, Z, P0~P9 to serve indirect addressing

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Operand	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	16/32-bit +/- number	V · Z P0~P9

Description

- Move (write) the data of S to a specified register D when the move control input "EN" =1 or from 0 to 1 (**P** instruction).

Example

Writes a constant data into a 16-bit register.

●

Performs logical AND operation for the data of Sa and Sb when the operation control input "EN" =1 or from 0 to 1 (**P** instruction). This operation compares the corresponding bits of Sa and Sb (B0~B15 or B0~B31). The bit in the D is set to 1 if both of the corresponding bits data of Sa and Sb is 1. The bit in the D is set to 0 if one of the corresponding bits is 0.

D			

- Performs logical OR operation for the data of Sa and Sb when the operation control input "EN" =1 or from 0 to 1 (**P** instruction). This operation compares the corresponding bits of Sa and Sb (B0~B15 or B0~B31). The bit in the D is set to 1 if one of the corresponding of Sa or Sb is 1. The bit in the D is set to 0 if both of the corresponding bits of Sa and Sb is 0.

FUN 20 D P →BCD	BIN TO BCD CONVERSION (Converts BIN data of the device specified at S into BCD and stores the result in D)	FUN 20 D P →BCD
---	--	---

Ladder symbol

Operand

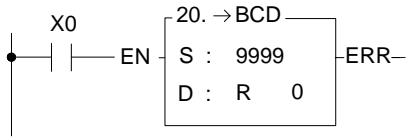

S : The register to be converted
D : The register to store the converted data (BCD code)
The S, D may combine with V, Z, P0~P9 to serve indirect addressing

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Ope- rand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3940	R3968	R5000	D0	16/32 bit	V · Z
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	+/- number	P0~P9
S	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
D		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>	<input checked="" type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>		<input type="radio"/>

- FB-PLC uses binary code to store and to execute calculations. If want to send the internal PLC data to the external displays such as seven-segment displays, it is more convenient for us to read the result on screen by converting the BIN data to BCD data. For example, it is more clear for us to read the reading "12" instead of the binary code "1100."
- Converts BIN data of the device specified at S into BCD and writes the result in D when the operation control input "EN" =1 or from 0 to 1 (P instruction). If the data in S is not a BCD value (0~9999 or 0~9999999), then the error flag FO0 is set to 1 and the old data of D are retained.

Example

16-bit BIN to BCD conversion

Ladder diagram	Key operations	Mnemonic code
	<div style="display: flex; flex-direction: column; align-items: center;"><div style="display: flex; gap: 5px;">ORGX^U0^{OPEN}ENT</div><div style="display: flex; gap: 5px;">FUN2^P0^{OPEN}ENT</div><div style="display: flex; gap: 5px;">9^Q9^Q9^Q9^QENT</div><div style="display: flex; gap: 5px;">R^Q0^{OPEN}ENT</div></div>	<div style="display: flex; flex-direction: column; align-items: flex-start;"><div style="display: flex; gap: 20px;">ORGX0</div><div style="display: flex; gap: 20px;">FUN20</div><div style="margin-top: 10px;">S : 9999</div><div style="margin-top: 10px;">D : R 0</div></div>

Basic Function Instruction

FUN 21 D P →BIN	BCD TO BIN CONVERSION (Converts BCD data of the device specified at S into BIN and stores the result in D)	FUN 21 D P →BIN
---	--	---

Ladder symbol		Operand	
Conversion control — EN	<div style="border: 1px solid black; padding: 5px; display: inline-block;"> 21DP.→BIN S : D : </div>	ERR — Error (FO0)	S : The register to be converted D : The register to store the converted data (BIN code) The S, D may combine with V, Z, P0~P9 to serve indirect addressing

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	XR
Operand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	V · Z
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	P0~P9
S	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
D	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

- The decimal (BCD) data must be converted to binary (BIN) data first in order for PLC to accept the data which is originally in decimal unit (BCD code) inputted from external device such as digital switch because the BCD data can not be accepted by PLC for its operations.
- Converts BCD data of the device specified at S into BIN and writes the result in D when the operation control input "EN" =1 or from 0 to 1 (P instruction). If the data in S is not in BCD, then the error flag FO0 is set to 1 and the old data of D are retained.
- Constant is converted to BIN automatically when store in program and can not be used as a source operand of this function.

Example	16-bit BCD to BIN conversion
